

CyberSathi

Blockchain Security Operations Report

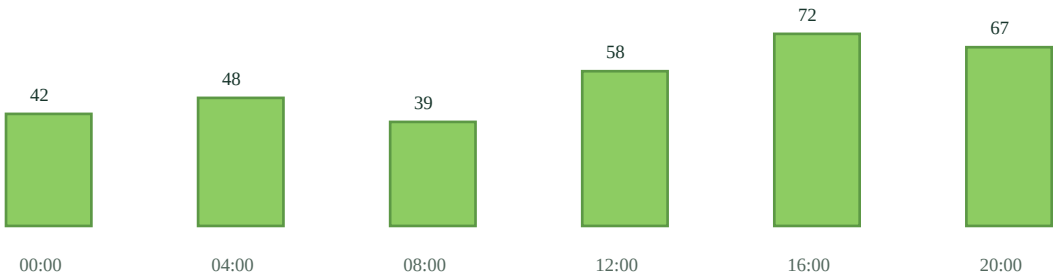

Generated 2026-08-10T12:26:24.996670+00:00

Executive assessment

CyberSathi detected elevated bridge activity and a validator rotation anomaly. No confirmed asset loss is present; operator approval is required before containment changes are applied.

Security score	Blockchain health	Model confidence	Threat posture
88/100	94%	91%	High

Risk movement

Explainable findings

Signal	Score	Evidence
Wallet velocity anomaly	82%	7 wallets crossed the configured transfer threshold.
Cross-chain bridge drift	76%	Bridge-04 has an unusual signing sequence.
Validator rotation	69%	Rotation occurred outside the approved change window.
Keystore access pattern	54%	Access volume is elevated but not confirmed malicious.

Infrastructure and response queue

Node	Role	Health	Status	Latency
Validator-01	Consensus	98%	Online	42 ms
Validator-02	Consensus	96%	Online	49 ms
Gateway-03	RPC Gateway	86%	Degraded	118 ms
Bridge-04	Bridge Relayer	61%	Review	204 ms

Incidents: INC-2048 (High) Suspicious validator rotation; INC-2047 (Medium) Rogue bridge contract activity; INC-2046 (Low) Unusual keystore access pattern

Attribution status

No verified attacker IP is available. Infrastructure signals do not prove identity or attribution.

Recommended controls

- Require multi-party approval for validator and bridge changes.
- Keep wallet velocity thresholds enabled across monitored chains.
- Archive incident evidence before closing containment actions.
